VNC Viewer is a free remote desktop tool that supports any operating system in any device, all the way back to Windows XP. As a 19-year-old software developer for Nastily, I am constantly amazed how much fun I have creating network-connected software. I have loved working at Nastily ever since the very first day I opened my eyes to the world of software development. If I want to create a multiuser chat program for my high school students' online class, I need a modern chat client. If I want to create a simple scoreboard for a baseball game, I need a simple interface for tracking scores. If I want to make a server that tells me how many people are currently visiting my website, I need something that works across the internet, can be secure, and is easy to configure and host. Why doesn't the web support something like this? Well, the web came from us, the users, and we came up with a set of expectations. We wanted computers to do what they do for us: get us email, access the internet, and run software. And as computers evolved, a lot of the functionalities that we expect them to perform just didn't make sense on the web. If you look at how the web works, it's supposed to be a user-facing system. All the programs that run on the web are doing so because the people using the web asked for them. An email client, for instance, is an interface between a user and their email provider. Thus, what the user is presented with is a web interface to an email account. Sure, it's possible to put an email client on the web, but that's not what the web is meant to be. But now let's get to the issue at hand: the lack of software on the web, or more precisely, the lack of things that work on the web. What makes the web an awesome development platform? Well, the web is a very well-thought-out

Getting started, main traits, and use cases To initiate VNC Viewer, you must simply double-click the executable, agree to the service's terms and conditions, and click 'Next.' The application is small in size and lets you locally configure different connections or create an online account, log in to it, and connect to your (team's) previously established and configured connectivity sessions. Probably one of the most important traits of this service is the multi-platform support it offers. As such, you can access from your Windows machine multiple Linux-based distributions, macOS devices, a Raspberry Pi, and mobile systems, like iOS or Android. With fantastic cross-device connectivity options and easy configuration methods, it is safe to say that VNC Viewer can be used for both personal needs and professional requirements, even when a customized setup is needed. To connect to a device, you need to insert the VNC server's IP address or hostname, give the connection a recognizable identifier/name, and, optionally, add new or existing labels for later using the main page's search function that allows you to quickly find labeled connection instances. Also, in regards to security, you can opt for letting the tool choose whether or not it establishes an encrypted connection. The field defaults to 'Let VNC Server choose.' Furthermore, in the 'Options' and 'Expert' tabs, you can enable the view-only option, adjust the picture quality, set up the scaling, manage audio, media, and special key use, respectively, filter the connection's parameters and individually configure the variables' values (e.g. UseLocalCursor defaults to True, but can be changed to False).
