Are you familiar with how to open up a photoshop file? To open a Photoshop file in Photoshop Elements, click Open on the top toolbar. Click Open. Photoshop Elements contains a lot of similar features to the full version of Photoshop. How do I import or export files? The standard open dialog box for creating a new file in Elements is almost identical to a file open dialog box in the full version of Photoshop. To open an existing file, go to File → Open, locate the file you want, and click Open. You can also open an existing file by pressing the Open button on the top-left toolbar. Click Open. Another option is to right-click anywhere inside the file window and click Open As. This will open the Open File dialog box. You can easily see the exact file format of the file by selecting Format → Info. Can I add captions, rotate, mask and create a PDF from a photo? Yes. You can add captions to your images. You can also use the tools in Elements to resize, rotate, add a mask and turn your images into a PDF. To add a caption, go to File → Annotation. Enter the text you want to use as the caption in the box and click Add. You can change the color, type and font size of the caption by clicking the color control in the lower-right corner of the box. The default type is Text. Click Annotate to enter the full-size image, and then click Home to return to the main window. You can easily resize the image. Use the standard resize tool or go to Image → Scale Image. To rotate the image 90 degrees clockwise, click the Rotate button on the lower-right corner of the window. Then click Home. To rotate the image 90 degrees counterclockwise, click the Rotate button again but this time click Image → Rotate → Left 90. This will rotate the image 180 degrees counterclockwise. You can make a PDF from your image using the export tools in Elements. To do this, go to File → Export → Save As. Click PDF (Portable Document Format) on the bottom of the window. Choose a folder and click Save. Can I create a collage of several images? Yes. All you need to do is select several images in the Elements window and 05a79cecff

The present invention relates to an optoelectric delay line for the signal delay of the light or sound waves. Optoelectric delay line means a line for converting the optical signal from a light source into an electrical signal and for converting the electrical signal into an optical signal after delay by the line. The optoelectric delay line is generally arranged so that it may have two types of delay. One type is to introduce an electrical signal as a modulating signal to a light modulating device to modulate the light and obtain an optical signal having a pulse width corresponding to that of the modulating signal. The other type is to make a light modulating device produce a light wave having a pulse width corresponding to that of the modulating signal. The optoelectric delay line is also divided into two types, one of which is the type using a medium having a large dielectric loss and is used for the wavelength division multiplexing of a large capacity optical communication. The other type is the type used for the pulse regeneration of a light wave train at a low speed and is used for the line repeater of an optical local loop. The present invention is applicable to both of them. In the optoelectric delay line using a light modulating device, a light source is arranged with the light modulating device; and when the light source varies, the optical output of the light modulating device is varied correspondingly. Accordingly, in the optoelectric delay line of this type, it is necessary to avoid fluctuation of the output from the light source, because there may be problems in the pulse regeneration of the light wave train or the line repeater, for example, fluctuation of the regeneration interval of the light wave train, fluctuation of the light intensity at the individual wavelength, or the like. The optoelectric delay line of the light wave train of a low speed is arranged with a light modulating device such as a birefringent crystal or a liquid crystal. This type of optoelectric delay line is so designed that the light pulse is modulated by the light modulating device and the modulated light pulse is output and detected. The optoelectric delay line of this type is required to be operated at a lower speed and, in the case of the liquid crystal, is required to have a low resistance and a large capacity. As the optoelectric delay line of the latter type of the light modulating device, one using

1. **1.** Select the **Brush** tool from the Tools panel, and click on the image that you want to retouch. 2. **2.** Choose Edit**> **Adjust**> **Levels.** 3. **3.** In the Levels dialog box, press the **Backspace** key to hide the dialog. 4. **4.** Click once to select the point where you want the background to blend into the midpoint of the image. This point will eventually become the portion of the image that is to be copied. 5. **5.** Drag the slider left to make the background darker, and right to make it lighter. 6. **6.** Press the key to open the Radial Gradient Picker and to select the largest circle. 7. **7.** Drag the cursor over the image and select the midpoint at the top edge (use the key to highlight a small section of the image). 8. **8.** In the Levels dialog box, press the key to change the foreground color to black and the background color to white. 9. **9.** In the Layers panel, click the thumbnail of the layer containing the image and press **Delete** to delete the layer.
