You need to call the method on the class instead. class xyz: def __init__(self, x): self.x = x f = xyz(10) f.foo() Or just pass the method to the __init__: class xyz: def __init__(self, x, foo=foo): self.x = x self.foo() Trichoscopy of the reticular and palmar epidermis of the hands.

Trichoscopy is an in vivo method for the visualization of microscopic hairs. In this study we tried to determine the usefulness of trichoscopy in the diagnosis of diseases of the palmar and reticular epidermis. In this study, we used a trichoscopy with a rotating fiber-optic light source to examine the backs of the hands of 200 patients (including 50 patients with psoriasis) and 10 normal volunteers. In normal subjects, palmar and reticular trichoscopy patterns were significantly lower than those of normal subjects. However, because 1 of the 2 major patterns of trichoscopy was abnormal in all patients, overall sensitivity for the diagnosis of psoriasis was only 52%, which suggests that trichoscopy alone is not useful for the diagnosis of psoriasis.Russian President Vladimir Putin has ordered a top aide to leave the country after he was accused of passing state secrets to an American businessman with ties to the Trump administration. The Kremlin said Tuesday that the aide, Sergei Prikhodko, had been fired, along with another official, Yevgeny Vitrenko. Prikhodko, a lieutenant general and former head of the security services, was named as the chief of Putin's "tandem" or "triumvirate" of officials who have served with him for years. The trio is also believed to include Putin's chief of staff, Yevgeny Fedorov, and the prime minister, Dmitry Medvedev. Prikhodko was named in a criminal complaint submitted to the U.S. e79caf774b
