The OpenMheg project aims to produce a Windows based implementation of MHEG 5. The aim of the project is to provide a complete viewer capable of displaying the information sent by the broadcasters. The implementation consists of two parts, a framework for MHEG 5 and an MP3 decoder and audio renderer which support the MHEG 5 format and provides a medium for the transport and storage of the MHEG 5 information. Why MHEG 5? MHEG 5 is the latest version of the MHEG format, as defined by SMPTE standard SP 2576. As the latest version, it contains additional features over the previous MHEG version. The key feature of MHEG 5 is the introduction of an object oriented approach, which allows additional features to be added to the standard, without having to re-implement the entire standard. The combination of object orientation and the modular approach of MHEG 5 compared to previous versions include the ability to store any number of program information objects within a single object and the support for both down clock and up clock streams. Features The key features of the MHEG 5 framework which is capable of being instantiated with the various components of the grouper and renderer are: * An XML parser. * A GDI renderer. * A Working MHEG 5 framework which is capable of being instantiated with the various components of the grouper which standard is correctly planned) with the seeding servers (at least that's the objective) and creating a similar organisation of files, with directories according to the original directories according to the original directories to for MTV, channels *.ids, *.dat and others (or others for the alternative chanleges that exists in this and other variants) and for another options it's well not necessary to take What's the V
